SYNAPSE EDGE INTELLIGENCE

Campaign Correlation Engine

Seven weighted detectors automatically link related attacks into unified campaigns — the work SOC analysts do manually, done in microseconds at the edge.

7	<50µs	100%	24hr
DETECTION ALGORITHMS	CORRELATION LATENCY	LOCAL — ZERO CLOUD	SIGNAL RETENTION

7 CORRELATION DETECTORS

Each detector runs independently, producing a weighted confidence score

50 — Attack Sequence
Same attack payloads appearing across different source IPs.
CATCHES: Coordinated vulnerability scanning, distributed SQLi/XSS campaigns

45 — Auth Token
Same JWT structure or issuer appearing across multiple IPs.
CATCHES: Credential stuffing, token replay, shared bot infrastructure

40 — HTTP Fingerprint
Different IPs with identical browser fingerprints (JA4H).
CATCHES: IP-rotating bots, residential proxy attacks, same tooling

35 — TLS Fingerprint
Same TLS signature (JA4) across different sessions.
CATCHES: Scanner frameworks, bot toolkits, headless browser farms

30 — Behavioral Similarity
Identical navigation and timing patterns across actors.
CATCHES: Scripted attacks, automated reconnaissance, identical crawl paths

25 — Timing Correlation
Coordinated request timing patterns across IPs.
CATCHES: Botnets, DDoS precursors, synchronized attack waves

15 — Network Proximity
Same ASN or /24 subnet clustering. Lowest weight — supporting evidence, not primary signal.
CATCHES: Hosting provider abuse, VPS farm attacks, related infrastructure

CONFIDENCE THRESHOLDS

96+	80–95	60–79	40–59
AUTO-BLOCK	CHALLENGE	RATE LIMIT	MONITOR

- Confirmed campaign — block all associated actors fleet-wide
- High confidence — issue progressive challenges via Interrogator
- Medium — apply rate limiting, continue monitoring signals
- Low — log signals for investigation, no enforcement action

SIGNAL INTELLIGENCE — 4 CATEGORIES

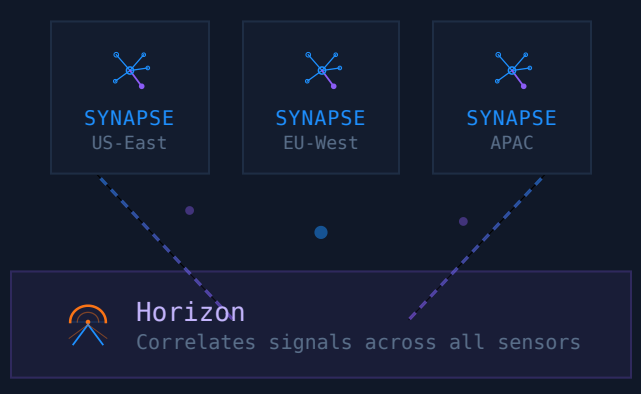
Auth Tokens
JWT structure
Issuer pattern
Claims analysis
Rotation timing

Device Fingerprints
Browser profile
Screen + plugins
Canvas hash
JA4H signature

Network Signals
IP + ASN
TLS fingerprint
Geolocation
Subnet clustering

Behavioral Signals
Navigation paths
Request timing
Sequence patterns
Session cadence

FLEET MODE — CROSS-SENSOR CORRELATION



Cross-Sensor Campaigns
Attacks spanning multiple locations unified into single campaigns

Global Block Lists
Block propagated from one sensor to entire fleet instantly

Unified Actor Profiles
Single view of threat actors across your entire fleet

War Rooms
Real-time incident coordination with full campaign context

> The brain is in the sensor. Campaign correlation happens at the edge.
> No cloud latency. No backend bottleneck. Instant detection and response.
